Problem 1:

```
import java.util.Scanner;

public class Main {
    public static void main(String[] args) {

        Scanner input = new Scanner(System.in);

        int score = input.nextInt();

        if (score >= 90) {
            System.out.printf("A%n");
        } else if (score >= 80) {
            System.out.printf("B%n");
        } else if (score >= 70) {
            System.out.printf("C%n");
        } else if (score >= 60) {
            System.out.printf("D%n");
        } else {
            System.out.printf("F%n");
        }

        input.close();
    }
}
```

Problem 2 :

```
import java.util.Scanner;

public class Main {
    public static void main(String[] args) {

        Scanner input = new Scanner(System.in);

        int year = input.nextInt();

        if ((year % 4 == 0 && year % 100 != 0) || year % 400 == 0) {
            System.out.printf("Leap Year%n");
        } else {
            System.out.printf("Not a Leap Year%n");
        }

        input.close();
    }
}
```

Problem 3 :

```
import java.util.Scanner;

public class Main {
    public static void main(String[] args) {

        Scanner input = new Scanner(System.in);

        double num1 = input.nextDouble();
        double num2 = input.nextDouble();
        char operator = input.next().charAt(0);

        switch (operator) {
            case '+':
                System.out.printf("%.2f%n", num1 + num2);
                break;

            case '-':
                System.out.printf("%.2f%n", num1 - num2);
                break;

            case '*':
                System.out.printf("%.2f%n", num1 * num2);
                break;

            case '/':
                if (num2 != 0) {
                    System.out.printf("%.2f%n", num1 / num2);
                } else {
                    System.out.printf("Cannot divide by zero%n");
                }
                break;

            default:
                System.out.printf("Invalid operator%n");
        }

        input.close();
    }
}
```

Problem 4 :

```
import java.util.Scanner;

public class Main {
    public static void main(String[] args) {
```

```
        Scanner input = new Scanner(System.in);

        int a = input.nextInt();
        int b = input.nextInt();
        int c = input.nextInt();

        if (a >= b + c || b >= a + c || c >= a + b) {
            System.out.printf("Not a valid triangle%n");
        } else {
            if (a == b && b == c) {
                System.out.printf("Equilateral%n");
            } else {
                if (a == b || a == c || b == c) {
                    System.out.printf("Isosceles%n");
                } else {
                    System.out.printf("Scalene%n");
                }
            }
        }

        input.close();
    }
}
```
